Reel Scripts • Week 1

Reel scripts, week 1

5 Aug 2026. Five talking-head scripts for Captions, matching the week spine in strategy §11b. Every one is built on a message Round 1 is already spending money on, so organic warms the exact ad the cold audience is about to see.

Batch these in one sitting. Roughly 30 minutes of filming for the week.

01 Before you film

Which Captions AI to use, and which to avoid.

Use the assistive tools freely. Auto-captions, the teleprompter, silence and filler-word trimming, reframing, eye-contact correction. All of that is still you on camera, just edited faster. That is the whole reason this unblocks reels.

Do not use the AI avatar or twin for any of these five. Every script below is a clinical read, and the authority is the point. A synthetic stand-in delivering a hormone explanation undermines the exact thing the reel exists to build, and a 40-plus professional audience notices. If you ever use the avatar, use it for logistics and announcements, never doctrine.

Do not post watermarked. Free tier brands the reel with someone else's logo.

Delivery. Speak at about 80% of normal pace. Pause after the first sentence, it is the scroll-stopper and it needs air. Look into the lens, not at your own face on the screen. No music. No jump cuts every two seconds. Calm authority is the differentiator for this audience, and energy edited to look like everyone else's content removes the only thing that separates you.

Length. 30 to 45 seconds. One idea each. Vertical 9:16.

The teleprompter trap. Reading kills the eyes. Learn the first line and the last line by heart and let the middle be prompted. Those two are where people decide to stay or leave.

02 Mon · Authority

Pairs with Ad 5, the four patterns

Twenty years of coaching, and effort was almost never the thing that separated people.

Plenty of the ones who got nowhere were working harder than the ones who got somewhere.

What separated them was whether the body was in a state that could use the effort going in.

Put a hard block of training into a body that is protecting itself and it does not come back as muscle. It does not come off as fat. It comes back as fatigue.

There are four patterns that do this, and each one answers to a different correction.

Which is why two people carrying the same fat can need opposite plans.

On screen: the four pattern names appearing one at a time as you say "four patterns".

03 Tue · Contrarian

The objection to Monday, killed

Eat less and move more is not wrong. It is just only right about one of the four patterns.

On a stress-driven pattern, cutting food harder adds another stressor to a system that is already defending itself. It holds tighter.

On an oestrogen-driven pattern, restriction reads as scarcity. The body conserves harder, and the harder you push, the tighter the hold.

On a testosterone-driven pattern, aggressive dieting costs you muscle, and muscle is the thing you were trying to protect in the first place.

So the same advice that fixes one pattern actively makes two others worse.

That is not a discipline problem. That is a targeting problem.

On screen: four ticks and crosses, one per pattern.

04 Wed · Pattern recognition

Pairs with Ad 2, the Fat Map. This one is the comment-to-DM engine.

Where your body stores fat narrows down which hormone is holding it there.

Front of the midsection, while your arms and legs stay lean. That is cortisol.

Mid-back, lower back and the flanks, with the front relatively spared. That is insulin.

Hips, glutes and outer thighs, and later it starts moving toward the middle. That is oestrogen.

And one that is not a place at all. The middle fills while muscle, tone and drive fall together. That is testosterone, and the giveaway is the muscle going, not the fat arriving.

Where it sits narrows it. What comes with it decides.

CTA, spoken: "Comment the word MAP and I will send you the full breakdown."

On screen: body diagram, zones highlighting as you name them.

This is the most important reel of the week. Every commenter is a warm-audience member and a DM conversation. Reply to all of them.

05 Fri · Coach perspective

Proof it holds

Most plans half work. There is a reason, and it is not you.

A plan built for the wrong driver still does something. You get a bit of movement early, then it stalls, and the obvious conclusion is that you need to try harder.

That is the trap. The half-result is what convinces people the plan was right and they were the problem.

Run a cortisol correction on an insulin pattern and almost nothing moves. Same effort, wrong target.

Which is why the read comes before the prescription. Prescribing before reading is guessing, and guessing is expensive when the cost is a year of your life.

On screen: nothing. Let this one be your face and the words.

06 Sun • Promo

Challenge invite

Fourteen days, free, and there is nothing to buy at the end of it.

Day zero, you do the intake and it reads what state your body is actually in right now.

Day seven, eight markers get scored against where they were on day one. The ones that move matter less than the ones that do not.

Day fourteen, you get the full pattern read. Which of the four is running yours, and what that specific one answers to.

If it turns out you have been running the right effort at the wrong target, fourteen days is a cheap way to find out.

CTA, spoken: "Link is in the bio."

07 Reusing these

Each script is also the caption for that day's post if you would rather run it as a static or carousel. And any of the five that outperforms is a **pre-validated ad**, which is the cheapest creative testing available. Note which one holds attention longest and tell me, it goes straight into the format-breaker rotation.
