

# Round 2 · Two cold streams

v1.9 · 14 August 2026. For the ad restart on **Monday 1 September**. Round 1 is archived.

---

## Why Round 1 is archived rather than continued

Round 1 was built four-patterns-equal, before we had looked properly at who is actually in the database. Three problems, none of them about the craft:

1. **Insulin drift was one of the four live ads**. Insulin is **one in twenty-five** of the profiles we have run. A quarter of the spend was aimed at four per cent of the audience.
2. **Nothing in the pack was about sleep or stress load** — the two worst-scoring sections we measure, and now the biggest lane.
3. **Everything routed to /challenge**. Fourteen days is a large first ask of a stranger.

The formula is unchanged and still correct: **\*\*pattern interrupt + burning intrigue + specific benefit\*\***. Only the aim has moved.

---

## The destination · the Body Decode LP

**Both streams land on /decode**. Updated 24 Aug 2026 at cutover; **/challenge** now redirects there, but the ads should point at **/decode** directly so the pixel is not learning on a redirect.

ad click → **Challenge landing page** → sign up → welcome email with portal access →  
**the scorecard is the first thing inside the portal**

So the scorecard **is** the first gate. It sits after the signup rather than in front of it, and that order is deliberate: name, email and phone are captured **before** any gate, so someone who stalls at the scorecard is still a lead we can chase. On a scorecard-first route they would leave nothing behind, because the public scorecard only asks for contact details after all five sections are answered.

The public **/scorecard** page stays the **warm and organic** front door. Cold paid and the gym-floor QR go direct to the Challenge, per the locked routing rule.

---

## Stream A · Neurowellness

**The lane**. Sleep, stress load, regulation. The biggest one.

**The proof**. Across **86 completed scorecards**, Sleep (1.80) and Stress Load (1.86) are the two worst-scoring sections. Training Response (2.05) is the best.

**The argument.** Capacity is fine. Regulation is gone.

## A1 · The wrong one

### Headline

Her best score out of five was 2.05 out of 3. Get your own five scored free in two minutes

### Primary text

Not one of these 86 women came to us about their sleep. They came about a body that would not move.

They train three or four times a week. They eat well most days. And they sleep badly, and have done for years, and not one person has ever asked them about it.

We have now scored 86 women on five things. Energy, sleep, stress, how they respond to training, and how they respond to fat loss.

Training came out the best of the five, at 2.05 out of three. On that scale a two means some progress, but inconsistent. That is the best thing about her.

Sleep came out the worst.

So the thing this group works hardest at is the thing least wrong with them. And the thing most wrong has never once been looked at.

Then they get handed a plan that starts by adding more training.

The Body Decode is free. Two minutes of questions, then your report. No card, nothing to cancel.

You answer them and your report opens straight away. Which pattern is behind it, why it is happening, what it usually gets mistaken for, and the three things that shift it. Then five short videos, one a day, walk you through it.

It is genuinely free, and there is nothing to buy to get it.

**Link description** · Five things scored. Most people are surprised by which one comes last.

## A2 · Four in ten

### Headline

You did not come here about sleep. It scores worst anyway. Find out where yours sits, free

### Primary text

Four in ten score worst on it, and it had been going on longer than the thing they actually came to us about.

Nobody comes to us about their sleep. They come because the fat will not move. Because a plan that used to work has stopped working. Because your body used to respond and now it does not.

Then we score you, and sleep comes out bottom of the five.

Not "a bit tired". Awake at 2am. Lying there doing sums. Up at 6 feeling like you never went to bed.

Here is why that matters more than the training.

Your body does not change during the session. It changes overnight. The session asks for the change. Sleep is when your body actually makes it.

Train hard on four hours of broken sleep and you are not building anything. You are just adding one more thing to recover from.

Of the 86 women we have scored, nearly four in ten came out at the bottom on sleep. Almost none of them came to us about it.

The Body Decode is free. Two minutes of questions, then your report. No card, nothing to cancel.

You answer them and your report opens straight away. Which pattern is behind it, why it is happening, what it usually gets mistaken for, and the three things that shift it. Then five short videos, one a day, walk you through it.

It is genuinely free, and there is nothing to buy to get it.

**Link description** · The one nobody assessed.

### A3 · Under-recovering

#### Headline

Two women, same complaint. One needs to train more, one needs to stop. A free read says which

#### Primary text

Same age, same words, same frustration. Put them in a room and they would agree about everything.

Two women, the same week. Tired all the time. Sessions feel flat. Body will not change.

One of them genuinely needs to do more.

The other is doing too much already, and every extra session is making it worse.

From the outside they are identical. Same words, same frustration, same effort.

That is why the woman training hardest in any group is so often the one getting the least back.

You cannot work out which one you are by trying harder. Trying harder is what both of them are already doing.

The Body Decode is free. Two minutes of questions, then your report. No card, nothing to cancel.

You answer them and your report opens straight away. Which pattern is behind it, why it is happening, what it usually gets mistaken for, and the three things that shift it. Then five short videos, one a day, walk you through it.

It is genuinely free, and there is nothing to buy to get it.

**Link description** · Two things that look the same from outside.

---

### A4 · 3.47am

#### Headline

If you recognise this screen, it is not discipline. Find out what your sleep actually scores, free

#### Primary text

Three forty-seven in the morning. Nothing is wrong. You are just awake, and already doing sums about tomorrow.

You fell asleep fine. That is the part that confuses people. Getting down was never the problem. It is waking at three or four and not getting back that almost nobody has ever had checked.

Here is what is usually going on.

Cortisol is meant to sit at its lowest around midnight and climb slowly before you wake. When the load has been high for long enough, that curve shifts earlier. The rise that should arrive at six arrives at three, and your body reads it as morning.

So you are not awake because you are worried. You are worried because you are awake. The waking came first, and the thinking filled the gap.

Of the 86 women we have scored, sleep is the lowest of all five sections, and nearly four in ten come out worst on it. Almost none of them came to us about their sleep. They came because the fat would not move.

Train hard on top of that and you are not building anything. You are adding one more thing to recover from.

The Body Decode is free. Two minutes of questions, then your report. No card, nothing to cancel.

You answer them and your report opens straight away, naming which pattern is behind it and the three things that shift it.

**Link description** · Not worry. A rhythm that moved.

## N1 · The circled one

### Headline

This is what a real scorecard looks like. The circled one is the section nobody ever assesses

### Primary text

Sleep and stress load were the two lowest, and neither had ever been looked at before she came to us.

This is a scorecard result. Five sections, each scored out of three.

Training response came out top at 2.05, which on that scale means some progress but inconsistent. Sleep came out bottom, and it is circled because it is the one that decides whether any of the training turns into anything.

A total of eight out of fifteen puts her in the lowest of the three groups. Depleted. That is roughly three in ten of the women we assess, and it is the group a hard plan makes worse rather than better, because she is already carrying more than she can absorb.

The Body Decode is free and scores your own five in about two minutes. No payment, no card, nothing to cancel.

Your report opens straight away, naming which pattern is behind it and the three things that shift it.

**Link description** · Five sections, scored out of three. Most people are surprised by the bottom one.

## N2 · What 86 scorecards say

### Headline

86 women scored on five things. The two that came out worst are the two nobody had checked

### Primary text

The best of the five averaged 2.05 out of three, which on that scale means some progress but inconsistent. Sleep was the lowest at 1.80.

That is not a small group and it is not a survey. It is 86 women who sat down and scored themselves on energy, sleep, stress load, training response and fat loss response.

The thing they work hardest at came out highest. The two things nobody had ever assessed came out lowest.

Which is why adding more training to that picture does not move it.

The Body Decode is free and scores your own five in about two minutes. No payment, no card, nothing to cancel.

**Link description** · The average of 86 scorecards, section by section.

## S1 · Her worst score

### Headline

Her worst score was the one nobody had ever checked. Get your own five scored free in two minutes

### Primary text

Sleep came out bottom of the five, and she had never once been asked about it.

She came to us about a body that would not change. Not about sleep, not about stress, not about anything you would put on a training plan.

Then we scored the five foundations and sleep came out bottom. One out of three.

That is not a coincidence and it is not unusual. Four in ten of the women we assess come out worst on sleep, and almost none of them raise it.

Which matters, because sleep and stress load are what decide whether the training turns into anything at all. You can do everything right above them and get nothing back.

The Body Decode is free and scores your own five in about two minutes. No payment, no card, nothing to cancel.

Your report opens straight away, naming which pattern is behind it and the three things that shift it.

**Link description** · Five sections, scored out of three. The bottom one surprises most people.

## S2 · Ready for the plan

### Headline

Only 18 women in 100 were ready for the plan they were given. Find out if you are, free

### Primary text

The other 82 were handed one anyway, and most of them blamed themselves when it stalled.

Eighty-eight women assessed. Eighteen in every hundred came out able to absorb a hard training plan.

Thirty-one per cent came out depleted, where a hard plan does not just fail, it makes things worse. Fifty-one per cent came out in the middle, which is a real result for six weeks and then a stall.

Same programme. Same discipline. Three completely different outcomes, decided before anybody started.

The Body Decode is free and scores your own five in about two minutes, so you find out which group you are in before a plan gets written.

No payment, no card, nothing to cancel.

**Link description** · 88 assessed. Most people are not in the group they think.

## Stream B · Readiness

**The lane.** Can this body take the load today. The frame, not a topic.

**The proof.** Of **88 people**, only **18% came out Ready**. Half came out Transitioning.

**The argument.** Everyone measures what you did. Almost nobody measures what you could survive.

### B1 · Eighteen per cent

#### Headline

88 assessed, 18 in every 100 ready for a hard plan. Find out if you are, free, in two minutes

#### Primary text

Thirty-one per cent come out depleted. For them a hard plan does not just fail, it makes things worse.

We have now assessed 88 women. Only 18 in every 100 came out ready for a hard training plan.

Everyone else got one anyway.

That is how plans are written. They assume a body that can take the work. Then the same programme goes to the woman who can take it and the woman who cannot, and only one of them gets a result.

Half of the women we assess come out in the middle. Not wrecked, not ready. Doing everything right and waiting for it to show up.

Give a hard plan to a body that cannot take it yet and it does not half work. You go backwards. Then you decide the problem was you.

It usually was not.

The Body Decode is free. Two minutes of questions, then your report. No card, nothing to cancel.

You answer them and your report opens straight away. Which pattern is behind it, why it is happening, what it usually gets mistaken for, and the three things that shift it. Then five short videos, one a day, walk you through it.

It is genuinely free, and there is nothing to buy to get it.

**Link description** · Most people are not in the group they think.

### B2 · The wrong question

#### Headline

Every plan asks how hard you can go. This one asks what you can take, and it costs nothing

#### Primary text

The scorecard scores five things, and only one of them is about effort.

Every plan asks how hard you can go. Nobody asks whether your body can take it right now.

What changes week to week is what your body can actually absorb. After a bad run of sleep. After a stressful few months. After the last couple of years you have had.

Push a body that cannot absorb it and it does not get fitter.

It holds on to fat. It holds on to fluid. It stops giving you sessions.

And because the effort went up and nothing changed, you assume you need to push harder still.

The Body Decode is free. Two minutes of questions, then your report. No card, nothing to cancel.

You answer them and your report opens straight away. Which pattern is behind it, why it is happening, what it usually gets mistaken for, and the three things that shift it. Then five short videos, one a day, walk you through it.

It is genuinely free, and there is nothing to buy to get it.

**Link description** · The question nobody asks first.

### B3 · Eight weeks away

#### Headline

The plan you keep quitting might be a good plan, just early. A free two-minute read tells you which

#### Primary text

Week one felt fine. By week six she had decided she just did not have the discipline for it.

She had started that plan before. Maybe twice. It worked for a fortnight, and then it did not.

Here is the part almost nobody says out loud, because there is no money in telling someone to wait.

It might be a good plan. It might just be too early for you.

There is a version of you it would work brilliantly for. She sleeps through. Her energy holds past 3pm. She is about eight weeks away.

Give the same woman the same programme two months later, after the thing underneath has been sorted out, and it does exactly what it was meant to do the first time.

So the first question was never what to do. It was what your body can take right now.

The Body Decode is free. Two minutes of questions, then your report. No card, nothing to cancel.

You answer them and your report opens straight away. Which pattern is behind it, why it is happening, what it usually gets mistaken for, and the three things that shift it. Then five short videos, one a day, walk you through it.

It is genuinely free, and there is nothing to buy to get it.

**Link description** · Not wrong. Early.

---

## The one metabolic ad · run it, but only one

Per the airtime rule this is one in ten, and it works as a **disqualifier** rather than a claim.

### M1 · One in twenty-five

#### Headline

The internet says insulin. In the women we assess it is one in 25. Find out which you are, free

### Primary text

Twenty-four of every twenty-five are cutting carbs for a problem they do not have.

Cut the carbs. Skip breakfast. Fast for sixteen hours.

In the women we assess, insulin is about one in twenty-five.

The other twenty-four are doing everything the insulin advice says, for a problem they do not have.

Insulin is real. When it is the one driving things, cutting the load works, and it works quickly.

It is just not what is going on in most of the women we assess.

There are four things that do this. One of them is yours, and aiming at the wrong one is how you lose a year.

The Body Decode is free. Two minutes of questions, then your report. No card, nothing to cancel.

You answer them and your report opens straight away. Which pattern is behind it, why it is happening, what it usually gets mistaken for, and the three things that shift it. Then five short videos, one a day, walk you through it.

It is genuinely free, and there is nothing to buy to get it.

**Link description** · Probably not the one you were told.

## The creative system · unchanged from Round 1

The visual system **is** the high-dopamine strategy, not decoration around it. Round 2 wears the same clothes; only the aim moved. Every ad carries all seven parts:

| **Part** | What it does |

|---|---|

| **Photo** | A real greyscale human in a real gym, so the frame does not read as an ad in the half-second before anyone decides. |

| **Artifact** | A product screen floating over the photo. **The highest-value element in the system** — it is proof, it is unfamiliar, and it is the thing the eye stops on. A different one in every ad. |

| **Tags** | Blue + white pair, lower left. |

| **Rule** | 4px blue, separating image from argument. |

| **Strap** | Headline with exactly **one** blue emphasis phrase, plus a grey subline. |

| **Ticker** | Blue marquee. |

| **Offer bar** | Free / no payment, so the price objection dies inside the image. |

Two arrangements, both carried over: **NEWS** (full-bleed photo, artifact upper right, strap beneath) and **SPLIT** (blue offer banner on top, white product card left, photo and headline right). A1 and B1 are SPLIT; the rest are NEWS.

**Why the sub changed, and it was not just the name.** It used to promise **"Training plan, nutrition guide, daily coaching"**. None of those are in the free tier any more; they moved into

the \$97 Blueprint at cutover. That is not a stale product name, it is a promise the product does not keep, and anyone clicking it would have arrived expecting a plan and been handed a read.

**The offer bar CHANGED at cutover, 24 Aug 2026.** It now reads *Free · The Body Decode*.

"Decode" is still the locked product term for paid cold ads; "readiness" is the category the tag pair carries.

**The offer zone carries the benefit, not just the product name.** It used to read *\*Free · 14-Day Body Decode Challenge over Find your pattern in 14 days\**. To a stranger that is two phrases they have never heard and a price. Pattern interrupt and burning intrigue were both strong; **the third leg of the formula — a specific benefit — was carried by nothing**, and that is also the leg that lets the algorithm find the right people.

It now reads: *Two minutes of questions. Then your report.* Set in sentence case, not tracked-out caps, because it is the one part of the image meant to be **read** rather than scanned.

**This costs no dopamine, because intrigue and clarity live in different zones.** The strap carries the curiosity gap, the offer bar carries what you get. Making the bar plainer never touches the hook. The ticker stays pure brand on purpose: a news ticker repeating a name is what makes the frame read as a broadcast rather than an ad, and filling it with offer language would undo the interrupt the whole system exists to create.

**SPLIT layout rebalanced (A1, B1).** It centred a ~730px content block in a ~1250px frame, so roughly 190px of dead black sat above *and* below and the composition had nothing anchoring it. Fixed without inventing content: the photo is much taller (a bigger photo is a better pattern interrupt anyway), the card rows breathe, and the card gained a footer explaining what the numbers mean — a stranger previously saw *1.80 /3* with no idea what good looks like. The score disc was also using `align-items:baseline`, which does no vertical centring at all, so the number sat high in its ring.

**Type rebuilt to the mobile floor (v1.9).** A 4:5 post renders about 430px wide on a phone against our 1080px canvas, so everything scales by roughly **0.4**. The artifact panel was running **11 to 16px** — four to six pixels on a phone. The proof element of the entire system, and nobody could read a word of it. **29 of 37 type declarations were under the floor.**

Everything is now at or above **30px**, per the locked scale: body 39, list rows 34–36, captions and notes 30–32, kickers 32, footer benefit 34. The panel had to grow from 344px to 660px to hold it, so it covers more of the photo. That is the right trade — the artifact is the thing the eye stops on.

**The SPLIT arrangement changed as a consequence.** Its headline lived in a ~400px side column, which capped it at a size nobody could read and forced every SPLIT headline to be four words long. The card and photo now sit side by side above the **\*\*same full-width lower third the NEWS**

arrangement uses\*\*, so the two arrangements differ only in their top zone and every headline gets the full width. SPLIT's blue top banner went with it: once it inherited the shared footer, it was carrying the offer twice.

**This defect is inherited, not new.** `build_ad4.py` and `build_ad5.py` — the Round 1 builders this system came from — carry the same 11-25px type. Anything rebuilt from them needs the same pass.

**Photos:** five of seven show a woman, matching a 93% female audience. Kade carries the two authority ads (B3 and M1) where the claim is "in the women we assess".

Build: `_creative_build/build_round2.py` → `public/creative/round2/`.

---

## Structure and budget

Same stage gate as Round 1, because the reasoning has not changed: Meta cannot optimise at \$7-10/day per ad set.

|||

|---|---|

| **Phase 1, weeks 1-2 | \$25/day, Stream A only.** A1, A2, A3 running inside the one ad set so creative tests in parallel. Stream B and M1 created but PAUSED. |

| **Gate** | CPL against target at the end of week 2. Hit → Phase 2. Miss → debug Stream A, do not expand. |

| **Phase 2, weeks 3-4 | \$75/day.** Unpause Stream B and the metabolic ad. |

**Stream A goes first** because it is the biggest lane and carries the strongest proof we own.

**Objective:** Lead, not CompleteRegistration. **Targeting:** broad. **CTA:** Learn More.

**Destination:** `/decode`.

---

## Pre-flight checklist

Unchanged from Round 1. Run it on every ad at the moment of upload.

- ☐ Image interrupts the pattern
- ☐ Headline creates a curiosity gap that only clicking closes
- ☐ A specific benefit is present so the algorithm can find the right people
- ☐ Lead-in copy earns the "see more" tap
- ☐ Readability grade 5 or below
- ☐ Under 2,200 characters
- ☐ Heavy line breaks, one idea per line
- ☐ Specific numbers, not vague claims
- ☐ Positive framing leads
- ☐ Link description is intriguing, not descriptive

- [ ] CTA button set to Learn More
- [ ] Creative, headline and copy all on one theme
- [ ] Does not look like an ad

---

## Numbers rule

**n=86 and n=88 are quotable exactly.** They are the strongest thing we own and the entire positioning is "they cite, we measure."

**n=27 numbers are ratios only** — roughly half, about a third, one in twenty-five. The pattern split is 13/10/3/1 out of 27 people and a decimal will move. Re-run

`scripts/state-of-the-data.ts` before upload and correct anything that has drifted.
