

// a short course · run every client to one standard

Coach Co-Pilot — How To Use It

01 Start here

The co-pilot is a doctrine-trained mentor you talk with. It rides on every page of the dashboard as a floating bubble. On a **client's profile** it has read that client's file and answers grounded in it. On **any other page** it reads your whole roster and answers about the method in general.

Two rules run through everything it does:

- **You approve everything.** Nothing it drafts or edits reaches a client on its own. It is always a draft you review and publish.
- **Doctrine always wins.** It never overrides a client's readiness gates, phase order, injuries, or safety — not for your instruction, and not for your saved preferences.

Work through the lessons below once and you will run every client to the same standard.

02 The lessons — one per capability

1. Explain a read (*on a client*)

Understand WHY the system landed a client where it did — the state, the phase, the gates — in plain terms you can act on.

- Open a client, tap the co-pilot bubble (bottom-right).
- Ask it to explain: *"Why did the synthesis put her in Remediation?", "Walk me through his fat map."*

Example: *"Why is capacity Amber for him?"* → it cites his recovery and sleep answers and what that means for load. **Won't do:** invent data. If the answer isn't in the file, it says so.

2. Pressure-test a call (*on a client*)

Have it argue against you, against the doctrine, so you don't talk yourself into progressing someone who isn't ready. This is the moat.

- State your intended call and ask it to challenge you.
- *"Doctrine says hold — talk me out of progressing him." "Should this be Restoration?"*

Example: *"I want to move her to Accumulation"* → it checks the readiness gates and tells you what has to be true first. **Won't do:** rubber-stamp you. If the gates aren't clear, it holds the line.

3. Review a plan against doctrine (*on a client*)

Catch what the engine got wrong before you publish — the single habit that lets any coach reach the standard.

- After you generate a program or nutrition plan, ask: *“Review his program against the doctrine.”*
- It reads the actual sessions and macros and flags what’s off.

Example: it catches intensity sitting in a Restoration block, a calorie target that leaked into the training plan, or a meal count fighting an appetite-suppression med. **Won’t do:** change the plan itself. It reviews and advises; you make the change and publish.

4. Draft a program (*on a client*)

Get a full, doctrine-correct starting spec instead of a blank form.

- Tap “ **Draft a program**”.
- It proposes phase, goal, frequency, duration, training age, competency — each with a reason.
- Review, edit the block name, tap “**Generate this draft**”.

Example: for a stressed Remediation client it proposes a Restoration block, capacity goal, conservative volume — and tells you why. **Won’t do:** publish. It only ever saves a DRAFT. Nothing reaches the client until you publish it on the program page.

5. Refine a draft (*on a client*)

Change one thing without re-rolling the whole plan — swaps, tweaks, and structural edits.

- Tap “ **Refine program**” (or “ **Refine nutrition**”), then describe ONE change.
- *“Swap the barbell squat for a hip thrust.” “Drop the bench to 3 sets.” “Add a fourth day.” “Drop Wednesday’s carries.”*
- It shows exactly what will change; tap Apply.

Example: *“Add a fourth day”* → it proposes a phase-appropriate session and adds it; the other three days stay byte-for-byte identical. **Won’t do:** make a change that breaks the phase, a gate, a stated injury, the frequency ceiling, or (nutrition) the protein anchor.

6. Draft & refine nutrition (*on a client*)

Everything above, for the nutrition plan — draft it, then edit foods and meals.

- Tap “ **Draft nutrition**” to propose the plan (entry state, protein anchor, carb demand, meals/day).
- Tap “ **Refine nutrition**” to change one thing: *“Swap the oats for berries.” “Drop to 3 meals.”*

Example: swap a food and it re-sums that meal's macros and the day's calorie band automatically — nothing desyncs. **Won't do:** allow a change that would break the protein anchor, the calorie floor, or a dietary restriction (it flags it instead).

7. Read your roster + morning brief (*anywhere*)

See who needs you across ALL your clients without opening each profile.

- On any non-client page, the bubble shows a red badge = clients awaiting you.
- Open it and tap "☀ **Morning brief**", or ask "Who's drifting this week?", "Who's due to progress?"

Example: the brief groups your roster by urgency, names the doctrine reason for each, and the single next step. **Won't do:** answer a deep single-client question from here — it points you to open that client's profile.

8. Set your preferences (*anywhere*)

Teach it how YOU like to coach so it applies that everywhere.

- Open the bubble on a non-client page → "What I can help with" → "⚙ **Set your coaching preferences**".
- Write plain guidance: "Favour 4-day splits when the gates allow." "Keep first blocks to 3 sets." "Prefer dairy-free swaps."

Example: from then on, its drafts and advice lean your way — where the doctrine allows. **Won't do:** let preferences override a client's readiness gates, phase, or safety. They are soft guidance only.

03 Put it together — worked walk-throughs

New client → their first block

1. Open the client. Ask the co-pilot to explain their read so you understand the state and phase.
2. Tap " **Draft a program**". Sanity-check the proposed phase/goal against what it told you.
3. Generate. Then ask it: "Review this program against the doctrine."
4. Fix anything it flags via "🔧 **Refine program**", then publish.

A client is drifting → triage it

1. From any page, tap the co-pilot bubble and hit "☀ **Morning brief**".
2. Find the client flagged as regressing; read the doctrine reason.

3. Open their profile, ask the co-pilot to pressure-test whether to hold or adjust.
 4. If a plan change is needed, refine the draft — one change at a time.
-

04 Keeping it honest — the flag loop

Every answer has a quiet **thumbs-down**. Use it whenever an answer is wrong or drifts from the doctrine. Flagged exchanges land in **Clients → Co-Pilot Review** to be checked and cleared. This is how the standard stays consistent as more coaches rely on it — catch drift before it spreads.

The best habit to build: after you generate any program or nutrition plan, ask the co-pilot to review it against the doctrine before you publish.

The co-pilot is coach-facing only — it never speaks to a client, and nothing it produces is sent without you.
