The 3-State Cheat Sheet

The 3-State Cheat Sheet

01 Depleted, Transitioning, or Ready - which one is your body actually in?

Your body isn't good or bad at losing fat. It's in a *state* - and the state decides whether the same effort works or backfires. Here is how to tell which one you're in, in about thirty seconds.

Depleted

The body is in protection mode. It's holding on to everything because nothing has told it it's safe to let go.

- Waking up puffy or unexplainably heavy
- A 3pm energy crash despite a full night's sleep
- Training hard for months with nothing moving
- Fat settling in new places - stomach, waist
- "I'm doing everything right and it's getting worse"

If this is you: more effort makes it worse. The body needs conditions, not punishment.

Transitioning

The body is coming out of protection but hasn't locked in. Progress is real but fragile - it holds while you white-knuckle it, then slips.

- Some markers improving, others still stuck
- Energy good on good weeks, gone on bad ones
- The scale moves, then bounces back
- You can feel it *could* work, if only it held

If this is you: the win is continuity. Don't break the thread.

Ready

The body responds to input the way it's supposed to. Effort lands. This is where most programs *assume* you already are.

- Consistent energy through the day
- Recovery matches training
- Inputs produce the expected output
- Fat responds to a sensible change

If this is you: now the standard advice actually works.

The catch: high performers almost always self-score Ready and read Depleted. Discipline hides depletion – you can feel fine and be running on empty.

Want the real read, not a guess? The free 2-minute Body State Scorecard reads your actual state.
