The 3pm Energy Map

The 3pm Energy Map

01 What your afternoon crash is actually telling you

That 3pm wall isn't a coffee problem or a discipline problem. It's your body's cortisol rhythm - and where it dips tells you which state you're in. Find your pattern.

Crash-then-wired

Flat by mid-afternoon, then wired at night, struggling to switch off.

Cortisol is firing at the wrong times. A classic Depleted-state signal - the rhythm is inverted, and you're running on stress hormones instead of steady energy.

The post-lunch coma

Fine in the morning, then a wall right after lunch.

A fuel-handling signal (insulin drift). Your body isn't using the meal the way it should. What you eat and *when* matters more than how much.

The all-day drain

Low from the moment you wake, no real peak.

Depletion running deep. The tank isn't refilling overnight. Sleep and recovery are the gate - not more caffeine, not more training.

The genuine dip

A small, brief lull that passes with a walk or a glass of water.

Normal. If this is you, your rhythm is largely intact.

The point: the same 3pm crash means different things in different bodies. This map is a general guide - your actual state is specific to you.

The free 2-minute scorecard reads which state is really driving *your* crash.
