Eat Less, Gain More?

Eat Less, Gain More?

01 Why eating less can backfire - and what a stuck body actually needs

You cut the food. You added the cardio. And somehow the body dug in harder. You're not lazy, and you're not doing it wrong. You're running the wrong instruction on a body that's in protection mode.

What's actually happening

A depleted, stressed body reads "less food, more training" as *more threat*. So it does the sensible thing for a body under threat: it holds on. Metabolism drops to match the lower intake. Fat goes to storage and stays. The harder you push, the tighter it holds.

This is why the effort that worked in your twenties now does nothing - or the opposite.

The three things that keep a stuck body stuck

1. **Chronic under-eating** - signals scarcity, so the body conserves.
2. **Too much hard training, not enough recovery** - more stress on a stressed system.
3. **No read** - you're guessing at the input without knowing the state underneath.

What it actually needs

Not more effort. The *right conditions* - enough fuel, enough recovery, and inputs matched to the state - so the body comes out of protection and starts releasing on its own.

The free 14-Day Body Decode Challenge shows you the other way: it reads your state first, then works *with* it instead of against it. No slashing, no punishing. Free for 14 days.
