The Insulin-Drift Checklist

The Insulin-Drift Checklist

01 7 signs your body is storing, not burning

Insulin-Drift is when your body quietly changes how it handles fuel. The carbs that used to be fine now go straight to storage. It isn't willpower - it's a shift in the machinery. Tick the ones that sound like you.

- **Carbs hit different than they used to.** A meal that was fine a year ago now leaves you heavy or foggy.
 - **You crash hard after eating**, especially mid-afternoon, and reach for more.
 - **Fat is settling around the middle** - stomach and waist - even if the rest holds.
 - **You're hungry again soon after a full meal**, like it didn't register.
 - **Energy is a rollercoaster** - sharp then flat, tied to when and what you ate.
 - **Cutting carbs hard "works" for a week, then stalls** - and comes back.
 - **Cravings feel physical, not mental** - not a discipline problem, a signal.
-

Three or more? Your body is likely storing rather than burning - and the fix isn't eating less, it's changing the signal that's telling it to store.

The free 14-Day Body Decode Challenge is built for exactly this pattern. It reads what your body is doing, then shows you the correction. No card, no punishing plan.
